1.0.1 Introduction to FreeRTOS

FreeRTOS is a real-time operating system kernel for embedded devices that has been ported to 40 microcontroller platforms. It is distributed under the MIT License.

It is designed to be small and simple. It is mostly written in the C programming language to make it easy to port and maintain. It also comprises a few assembly language functions where needed, mostly in architecture-specific context-switching routines used by the scheduler. These routines, which are CPU-dependent, are called *ports*.

FreeRTOS doesn't contain any device drivers: these are to be provided by board developers in the form of a **BSP** (*Board Support Package*).
